

15

**ABSTRACT**

16       A method and system for determining geographic location and mental state of a  
17       user. A GPS circuit is to generate signals representing a geographic location. The system  
18       uses a host computer and a local computer connected to each other over a network. A  
19       keypad is used to enter provided sequence information which is sent to the host computer  
20       if entered within a set period of time along with geographic location information provided  
21       by a GPS system and serial number information. The host computer verifies that the  
22       sequence information, serial number and geographic location information are as expected  
23       and if so, allows a user access to certain information provided by the host system.
